6. Antenna parameters

6.1. Antenna test prototype signal

Figure 8 Application circuit diagram

- If the IO port is used as PWM, it is recommended to reserve a 4.7K pull-down resistor around the module. Especially in the application of light control, it can prevent the flashing light phenomenon at the moment of power-on start.
- IO8/NC pins, which are not available by default. If you need to use it, please contact Ai-Thinker.

6.2. Recommend PCB footprint size

图 9 推荐 PCB 封装尺寸

- When making the PCB patch package, please pay attention to the welding pad does not shrink into the module inside, to prevent a short circuit to the back test point and leading to poor patch.

6.3. Antenna layout requirements

- The module is required to be used by an external antenna.
- In order to meet the performance of the antenna, the metal parts are not placed around the antenna, away from the high-frequency devices.

6.4. Power supply

- Recommended 3.3V voltage, peak current above 500mA.
- Power supply is recommend to use LDO; if the DC-DC is used, the ripple is recommended to be controlled within 30mV

- DC-DC power supply circuit proposes to reserve the dynamic response capacitance to optimize the output ripple with large load changes.
- It is recommended to add ESD devices to the 3.3V power interface.

Figure 10 DC-DC step-down circuit diagram

6.5. GPIO

- There are some IO ports on the periphery of the module. If you need to use it, it is recommended to connect a 10-100 ohm resistor in series with the IO port. This inhibits overshoot and makes both sides level more stable. It is helpful for EMI and ESD.
- For special I/O ports to be pulled up and down, refer to the direction for use in the specifications, which may affect the module start-up configuration.
- The IO port of the module is 3.3V. If the IO level of the main control and the module do not match, a level convert circuit needs to be added.
- If the I/O port is directly connected to a peripheral port or terminals, for example, a pin row, reserve an ESD device near the terminal of the I/O cable.

7. Storage conditions

Products sealed in moisture-proof bags should be stored in a non-condensing atmosphere of <math><40\text{ }^\circ\text{C}/90\%\text{RH}</math>.

The module has a moisture sensitivity rating of MSL 3.

After the vacuum bag is opened, it must be used within 168 hours at $25\pm 5^\circ\text{C}/60\%\text{RH}$, otherwise it needs to be baked before it can be put on line again.
