## 7. Design guidance

### 7.1. Application circuit

**Figure 11 Application guidance circuit**

- If the IO port is used as PWM, it is recommended to reserve a 4.7K pull-down resistor around the module. Especially in the application of light control, it can prevent the flashing light phenomenon at the moment of power-on start.
- IO8/NC pin, which are not available by default. If you need to use it, please contact Ai-Thinker.

## 7.2. Recommend PCB footprint size

**Figure 12 Recommend PCB footprint size**

- When making the PCB patch package, please pay attention to the welding pad does not shrink into the module inside, to prevent a short circuit to the back test point and leading to poor patch.

## 7.3. Antenna layout requirements

- The following two methods are recommended for the installation position on the mainboard:

Option 1: put the module on the edge of the motherboard, and the antenna area extends out of the edge of the motherboard.

Option 2: put the module on the edge of the motherboard, the edge of the motherboard at the antenna position hollowed out an area.

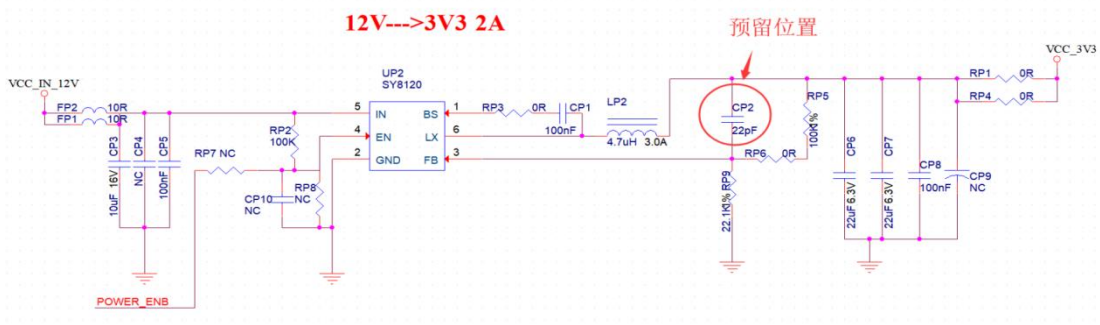

- In order to meet the performance of onboard antenna, it is forbidden to place metal parts around the antenna and keep away from high frequency devices.

**Figure 13 Antenna layout diagram**

### 7.4. Power supply

- Recommended 3.3V voltage, peak current over 500mA.
- Power supply is recommend to use LDO; if the DC-DC is used, the ripple is recommended to be controlled within 30mV
- DC-DC power supply circuit proposes to reserve the dynamic response capacitance to optimize the output ripple with large load changes.
- It is recommended to add ESD devices to the 3.3V power interface.

**Figure 14 DC-DC step-down circuit diagram**

## 7.5. GPIO

- There are some IO ports on the periphery of the module. If you need to use it, it is recommended to connect a 10-100 ohm resistor in series with the IO port. This inhibits overshoot and makes both sides level more stable. It is helpful for EMI and ESD.
- For special I/O ports to be pulled up and down, refer to the usage instructions in the specifications, which may affect the module startup configuration.
- The IO port of the module is 3.3V. If the IO level of the main control and the module do not match, a level conversion circuit needs to be added.
- If the I/O port is directly connected to a peripheral port or terminals, for example, a pin row, reserve an ESD device near the terminal of the I/O cable.

Figure 15 Level convert circuit

## 8. Storage conditions

Products sealed in moisture-proof bags should be stored in a non-condensing atmosphere of  $<40^{\circ}\text{C} / 90\%RH$ .

The module has a moisture sensitivity rating of MSL 3.

After the vacuum bag is opened, it must be used within 168 hours at  $25\pm 5^{\circ}\text{C} / 60\%RH$ , otherwise it needs to be baked before it can be put on line again.
